

PDFGen

print-to-pdf for WordPress

PDFGen let's you effortlessly generate rich PDF's from Pages and Posts on your WordPress site that you can customize, download, and view anywhere. The plugin leverages the TCPDF library to deliver a massive set of [advanced PDF features](#).

Usage

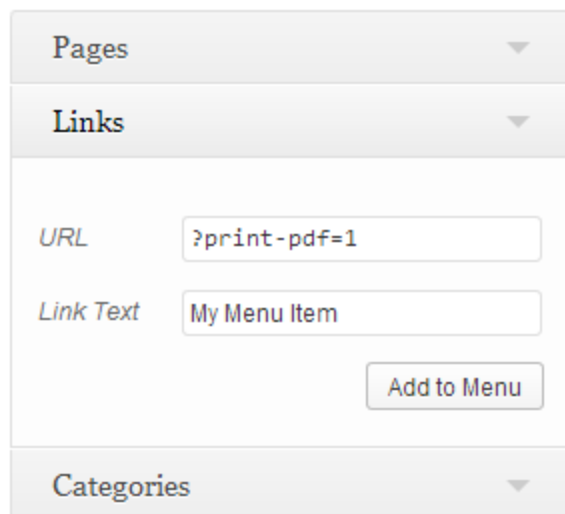

As a Shortcode

```
[pdfgen]
```

The above shortcode let's you easily add a print-to-pdf button for that page or post. Simply copy/paste it into the editor and the link will automatically be generated for you.

As a Menu

Under the hood, PDFGen simply looks for `?print-pdf=1` in the address bar. This means you can add a Menu Link like so:

The image shows a screenshot of the WordPress menu editor. It features a sidebar with 'Pages' and 'Links' sections. The 'Links' section is active, showing a form with 'URL' set to '?print-pdf=1' and 'Link Text' set to 'My Menu Item'. An 'Add to Menu' button is visible below the form. At the bottom, there is a 'Categories' section.

Through PHP

If you'd rather modify your template files directly, simply drop in `<?php echo PDFGEN_make()` `?>`

Space separated list of extra classes to apply to the PDFGen links, which by default have .pdfgen

Content

The text and/or image to use.

Layouts

PDFGen searches your themes directory for a folder called “pdf-templates”, and populates the the “Layouts” field. These templates should only contain the PDF build instructions, see “vendor/tcpdf/tcpdf/examples” inside the PDFGen folder for examples.

Theming

PDFGen ships with a default theme called **default.php** which can be used for most cases as it builds in a header (with logo, title, and author) and a footer (with page numbering). If you need customized templates, however, you can easily build them using the [TCPDF library](#).
